

TELL IT WHAT TO DO. WATCH IT THINK.

No joystick. No remote control. No cloud. Say the words — this robot ranks its **library of preprogrammed behaviors**, picks the best match, and does the whole job itself, showing its thinking **live on screen** as it works.

1 · SEE

The same kind of **AI vision** as a **self-driving car**: a neural net spots **80 kinds of objects**, ~6× a second, and judges distance with two lenses.

2 · PLAN

No map is given. It draws the room's floor plan from scratch with lidar, and the classic **A* algorithm** plots the safest route — **3 fresh plans a second**.

3 · MOVE

It chases a **sliding point ahead on its route** — that's why the driving looks **smooth, not robotic** — and it **reroutes** the moment something blocks the way.

Push the ball to the wall

The crowd favorite: it **hunts the ball down**, lines up behind it, and shoves it home until it **feels the ball pin** — using nothing but its eyes.

Say:

"push the ball to the wall"

Follow me

It **locks onto the nearest person** and tags along at a polite **1-meter distance** — it will never drive into you. Works on dogs too.

Say:

"follow me" · "follow the dog"

Explore the room

Set it loose: it **finds the emptiest open space**, drives there, and repeats — roaming the whole room **without hitting a thing**.

Say:

"go explore"

3 green dots = go

camera · lidar · wheels — the robot checks its own health before every run
